Native Plants

Bring life to your
landscape with
native plants

If you have a native plant garden, chances are you are enjoying blooms as they come and go and are entertained by many garden visitors (insects, butterflies, birds) and perhaps a few human guests as well! You are in between the hub-bub of spring planting and the commotion of preparing for winter.

Here are three garden tasks you can easily fit into your schedule, allowing lots of time to enjoy your native plantings.

- Evaluate what worked well and what could be improved. Native plants are specialists and perhaps some are not sited in their ideal location. Make a list of plants that may need to be moved and plants you would like to add. Perennials are best planted by labor day so they establish root growth going into the winter.
- Check newly installed plants for water. Feel the soil 6"-8" below the surface. If it is dry, you need to water. All plants -- even natives -- need water the first year they are planted. Water slowly and deeply.
- Consider converting a small portion of your lawn into a meadowscape. Pictured above is a tiny meadow, or 'meadowscape' planted at the nursery last September. Stop in for more information on how you can create a meadowscape.
