EDGE of the Woods Native Plants

Drosera filiformis
Threadleaf Sundew

- Small, pink-purple flowers are formed on small stalks throughout the summer. Considered to be the most attractive sundew species for any garden!
- Full sun. Keep moist or wet.
- Native to bogs, fens, and coastal plain ponds in Florida, North Carolina, Maryland, Pennsylvania, New York, New Jersey, and Massachusetts.
- Hardy from USDA hardiness zones 5-8. They require a cold winter dormancy under 55°F.
- Unlike the flytrap and the pitcher plant, which digest their prey "inside" a structure, the sundew digests its prey right on its exterior. One of the easiest digestions to view.
